IMAGEMATE MOVIE SOFTWARE FOR THE ELMO TT-02u and TT-02s

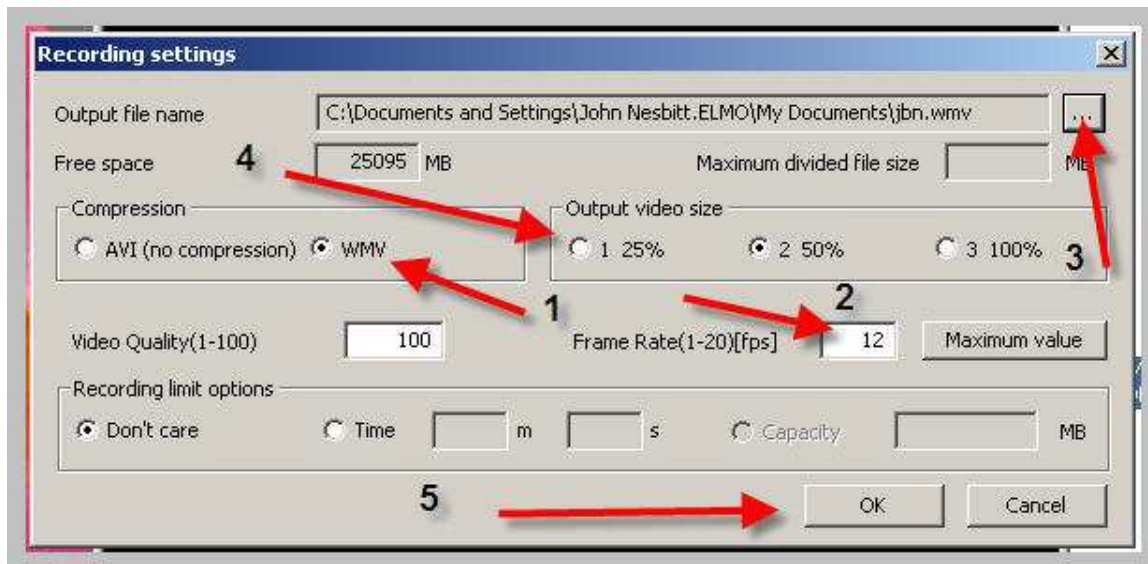

This training session will assume that you have loaded the Imagemate Movie Creation software to your Windows computer. This software should be added to our web site in November, 2008. The software is for Windows only and can be downloaded at no charge at www.elmoussa.com.

Once you bring up the software you will be able to make a movie (video only) from the ELMO TT-02s. Note that you must have the 2.0 USB port hooked from the ELMO document camera to the Windows computer.

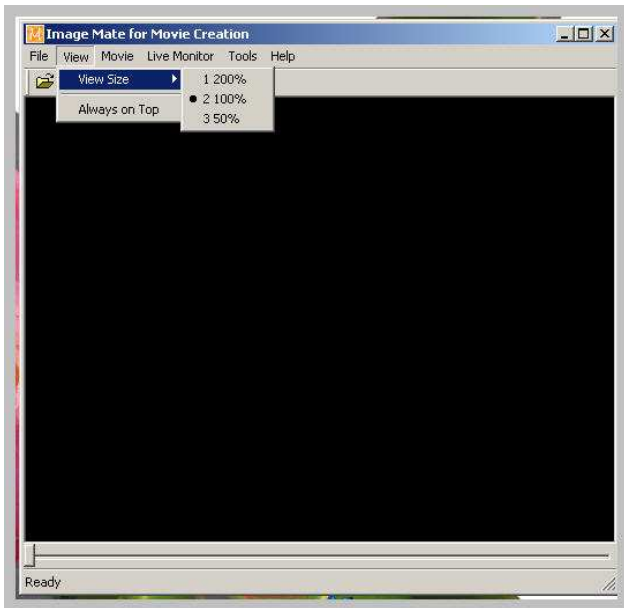

The first thing that you have to do is create the proper recording settings. Click on Tools and then click on Recording settings.

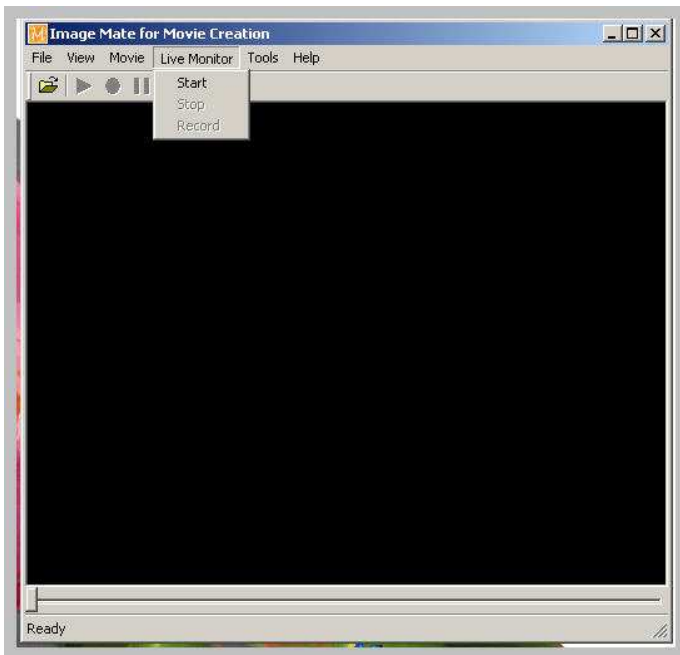

You can work with the five following settings:

- 1 You first will choose the compression setting. If you choose “No Compression” you will build a rather large video file.
- 2 The second setting will give you the number of frames per second that your computer can handle. Either click on Maximum value which will let the computer choose the maximum setting that your computer will work comfortably with or type in a number between 1 and 20.
- 3 You can name your file by clicking the button next to the Output file name. Click on the button and then use your mouse to erase the WVM file. Note that Output.wmv is the factory setting. You can overwrite any file. The software will ask you if you want to overwrite. It is strongly suggested that you give EASH file its own name.
- 4 Your next choice is the Output video size. Remember bigger video size increases the size of your total file.
- 5 Once you are all set click on the OK button.
- 6 Note the other settings. “Recording limit options” lets you create a movie to any size. You can choose the time that you want if you click “Time”. “Video quality” will let you choose the size and resolution of the file.

First you can set the View size of your Movie.

You can set your window from 50% to 100% to 200%. You

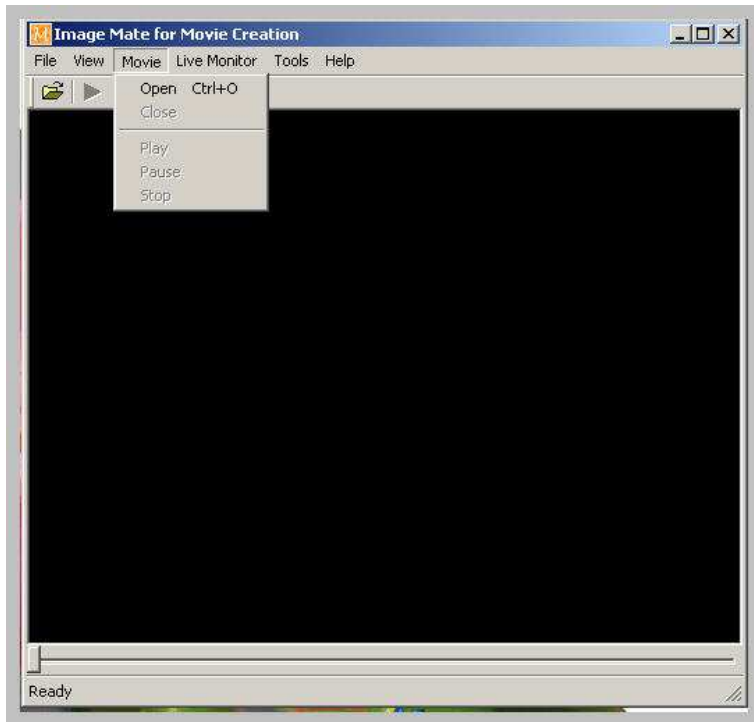

Go to the Live Monitor and click on Start. You will see a live image on your computer screen coming from the ELMO TT-02s. If you do not see the live image check your cables. The document camera must be on and the USB 2.0 port must be hooked to both the ELMO and the computer.

Once you bring up the live image the words Stop and Record will no longer be ghosted.

Click on record and the software will ask you if you want to overwrite the file. If you do not want to overwrite the file go back to settings and change the file name.

When you are done with the movie click on the Stop button with your mouse.

To view your movie do the following:

Click on the Open button and bring up the file that you just created.

Double click on the Blue button twice to view the movie file.
